

Netflix Content Analytics Using SQL

Project Overview

This project demonstrates the application of SQL for exploratory data analysis and business intelligence on Netflix's content catalog. The analysis focuses on uncovering content trends, evaluating distribution across countries, identifying top-performing directors, examining audience ratings, and analyzing release patterns.

Business Problem

Streaming platforms generate massive volumes of content-related data. Understanding content distribution, audience targeting, production trends, and platform growth requires effective data analysis techniques. This project answers key business questions that help evaluate Netflix's content portfolio and content acquisition strategy.

Key Analysis Areas

- Content distribution by type (Movies vs TV Shows)
- Geographic analysis of content production
- Year-over-year content release trends
- Content rating distribution analysis
- Genre-specific content exploration
- Director performance analysis
- Platform content growth analysis
- Country-wise latest content identification
- Long-duration content analysis
- Advanced ranking and segmentation techniques

Technical Skills Demonstrated

- SQL Query Writing
- Data Exploration & Profiling
- Data Aggregation
- Conditional Filtering
- Grouping & Sorting
- String Manipulation
- Date Functions
- Subqueries
- Common Table Expressions (CTEs)
- Window Functions
- Ranking Functions
- Business-Oriented Data Analysis

Tools Used

SQL, PostgreSQL / MySQL, CSV Dataset, GitHub

Project Outcome

The analysis provides meaningful insights into Netflix's content ecosystem and demonstrates how SQL can be used to solve real-world business problems through data-driven decision making.
